

ÈΧΔS

**REF200** 

SBVS020C - SEPTEMBER 2000-REVISED FEBRUARY 2020

# **REF200 Dual Current Source and Current Sink**

#### 1 Features

Completely floating: no power supply or ground connections

High accuracy: 100 µA ±0.5%

Low temperature coefficient: ±25 ppm/°C
Wide voltage compliance: 2.5 V to 40 V

Includes current mirror

# 2 Applications

- · Sensor excitation
- · Biasing circuitry
- · Offsetting current loops
- Low voltage references
- · Charge-pump circuitry
- Hybrid microcircuits

## 3 Description

The REF200 combines three circuit building-blocks on a single monolithic chip: two 100-µA current sources and a current mirror. The sections are dielectrically isolated, making them completely independent. Also, because the current sources are two-terminal devices, they can be used equally well as current sinks. The performance of each section is individually measured and laser-trimmed to achieve high accuracy at low cost.

The sections can be pin-strapped for currents of 50  $\mu$ A, 100  $\mu$ A, 200  $\mu$ A, 300  $\mu$ A, or 400  $\mu$ A. External circuitry can obtain virtually any current. These and many other circuit techniques are shown in the *Application Information* section of this data sheet.

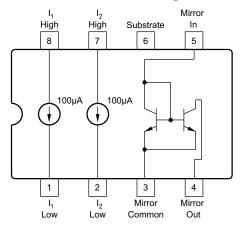

The REF200 is available in an SOIC package.

#### **Device Information**(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)	
REF200	SOIC (8)	3.91 mm × 4.90 mm	

(1) For all available packages, see the package addendum at the end of the data sheet.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
	Applied voltage	-6	40	V
	Reverse current		-350	μΑ
	Voltage between any two sections		±80	٧
	Operating temperature	-40	85	°C
T <sub>stg</sub>	Storage temperature	<b>-</b> 55	150	°C

<sup>(1)</sup> Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Charged-device model (CDM), per JEDEC specification JESD22-C101 (1)	±750	V

JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

## 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM MAX	UNIT
$V_{COMP}$	Compliance voltage	2.5	40	V
T <sub>A</sub>	Specified temperature range	-25	85	°C

## 7 Detailed Description

#### 7.1 Overview

The REF200 device combines three circuit building-blocks on a single monolithic chip—two 100-µA current sources and a current mirror. The sections are dielectrically isolated, making them completely independent. Also, because the current sources are two terminal devices, they can be used equally well as current sinks. The performance of each section is individually measured and laser-trimmed to achieve high accuracy at low cost.

## 7.2 Functional Block Diagram

### 7.3 Feature Description

## 7.3.1 Temperature Drift

Drift performance is specified by the *box method*, as illustrated in Figure 1. The upper and lower current extremes measured over temperature define the top and bottom of the box. The sides are determined by the specified temperature range of the device. The drift of the unit is the slope of the diagonal, typically 25 ppm/°C from –25°C to +85°C.

Product Folder Links: REF200

#### 7.4 Device Functional Modes

The three circuit sections of the REF200 are electrically isolated from one another, using a dielectrically-isolated fabrication process. A substrate connection is provided (pin 6), which is isolated from all circuitry. This pin should be connected to a defined circuit potential to assure rated DC performance. The preferred connection is to the most negative constant potential in the system. In most analog systems, this would be  $-V_S$ . For best ac performance, leave pin 6 open and leave unused sections unconnected. Figure 10 shows the simplified circuit diagram of the REF200.

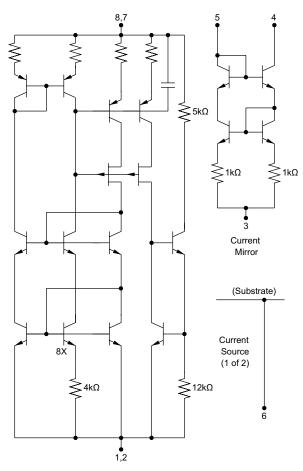

Figure 10. Simplified Circuit Diagram

## 8 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

#### 8.1 Application Information

Applications for the REF200 are limitless. Application Bulletin AB-165 (SBOA046) shows additional REF200 circuits as well as other related current source techniques. In this section, a collection of circuits are shown to illustrate some techniques.

If the current sources are subjected to reverse voltage, a protection diode may be required. A reverse voltage circuit model of the REF200 is shown in Figure 6. If reverse voltage is limited to less than 6 V or reverse current is limited to less than 350  $\mu$ A, then no protection circuitry is required. A parallel diode (see (a) in Figure 17) protects the device by limiting the reverse voltage across the current source to approximately 0.7 V. In some applications, a series diode may be preferable (see (b) in Figure 17), because it allows no reverse current. This configuration, however, reduces the compliance voltage range by one diode drop.

#### 8.2 Typical Application

Figure 11 shows the schematic of a circuit that translates RTD resistance to a voltage level convenient for an ADC input. The REF200 precision current reference provides excitation and an instrumentation amplifier scales the signal. The design also uses a 3-wire RTD configuration to minimize errors due to wiring resistance.

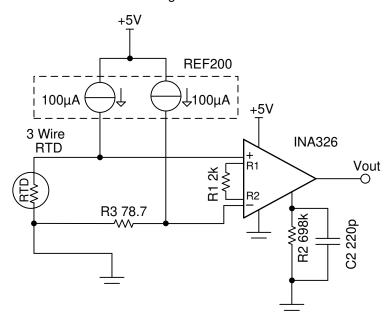

Figure 11. RTD Resistance to Voltage Converter Schematic

## **Typical Application (continued)**

#### 8.2.1 Design Requirements

The design requirements are as follows:

Supply Voltage: 5 V

RTD temperature range: -50°C to +125°C

• RTD resistance range 80.3  $\Omega$  to 147.9  $\Omega$ 

Output: 0.1 V to 4.9 V

The design goals and performance are summarized in Table 1. Figure 15 depicts the measured transfer function of the design.

Table 1. Comparison of Design Goals, Calculations, Simulation, and Measured Performance

V <sub>OUT</sub>	RTD	GOAL	CALCULATED	SIMULATED	MEASURED
V <sub>OUT</sub> maximum scale	80.3 Ω	0.1 V	0.112 V	0.117 V	0.11 3 V
V <sub>OUT</sub> minimum scale	142.9 Ω	4.9 V	4.83 V	4.82 V	4.862 V

#### 8.2.2 Detailed Design Procedure

Figure 12 and Figure 13 shows the schematic of the RTD amplifier for minimum and maximum output conditions. This circuit was designed for a  $-50^{\circ}$ C to  $150^{\circ}$ C RTD temperature range. At  $-50^{\circ}$ C the RTD resistance is  $80.3~\Omega$  and the voltage across it is 8.03~mV (V<sub>RTD</sub> =  $(100~\mu\text{A})$  ( $80.3~\Omega$ ), see Figure 2). Notice that R3 develops a voltage drop that opposes the RTD drop. The drop across R3 is used to shift amplifiers input differential voltage to a minimum level. The output is the differential input multiplied by the gain (Vout =  $698 \cdot 160~\mu\text{V} = 0.111~\text{V}$ ). At  $150^{\circ}$ C, the RTD resistance is  $148~\Omega$  and the voltage across it is 14.~8~mV (V<sub>RTD</sub> =  $(100~\mu\text{A} \times 148~\Omega)$ ). This produces a differential input of 6.93~mV and an output voltage of 4.84~V (V<sub>OUT</sub> =  $698 \cdot 6.93~\text{mV} = 4.84~\text{V}$ ), see Figure 13). For more detailed design procedures and results, refer to the reference guide, *RTD to Voltage Reference Design Using Instrumentation Amplifier and Current Reference* (TIDU969).

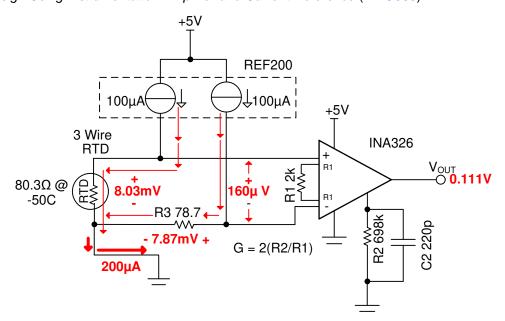

Figure 12. RTD Amplifier with Minimum Output Condition

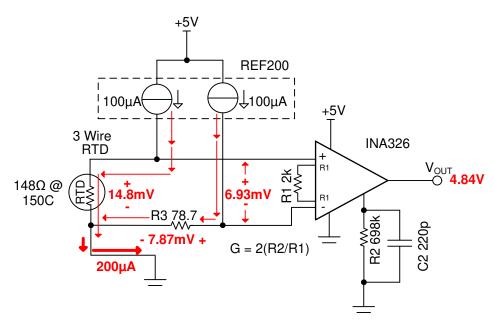

Figure 13. RTD Amplifier with Maximum Output Condition

#### 8.2.2.1 Lead Resistance Cancelation (3-Wire RTD)

Figure 14 shows the 3-wire RTD configuration can be used to cancel lead resistance. The resistance in each lead must be equal to cancel the error. Also, the two current sources in the REF200 must be equal. Notice that the voltage developed on the two top leads of the RTD are equal and opposite polarity so that the amplifiers input is only from the RTD voltage. In this example, the RTD drop is 14.8 mV and the leads each have 1 mV. Notice that the 1 mV drops cancel. Finally, notice that the voltage on the 3rd lead (2 mV) creates a small shift in the common mode voltage. In some applications, a larger resistor is intentionally added to shift the common-mode voltage. However, the INA326 has a rail-to-rail common mode range, so it can accept common-mode voltages near ground.

# 9 Power Supply Recommendations

The REF200 device has completely floating current sources and current mirror. The REF200 device has a wide compliance voltage range from 2.5 V to 40 V.

### 10 Layout

#### 10.1 Layout Guidelines

Figure 42 illustrates an example of a printed-circuit-board (PCB) layout for a data acquisition system using the REF2030. Some key considerations are:

- Minimize trace lengths in the current source and current mirror paths to reduce impedance.
- Using a solid ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup.
- Place the external components as close to the device as possible. This configuration prevents parasitic errors (such as the Seebeck effect) from occurring.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when absolutely necessary.

### 10.2 Layout Example

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

- (3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.
- (4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties.
